

# Lab Coating Line

This line is designed primarily to make cast film. But, there is also a rubber nip roll (orange) that can be pressed downward by air cylinders into a web for extrusion coating. The web payoff (for paper, foil, fabric, film, etc.) is not shown in this picture. This take off is designed for versatility in applications where short rolls (up to a few hundred feet) need to be coated. Horizontal take offs, for vertical dies, are also available.
